

## Main - FindClass

Want to find which jar a java class is coming from? Then do this:

```
Class clazz = Class.forName("com.sleepycat.jdbc.DatabaseException");
java.security.ProtectionDomain dom = clazz.getProtectionDomain();
java.security.CodeSource cs = dom.getCodeSource();
java.net.URL url = cs.getLocation();
out.println(url.toString());
```

Of course, replace "com.sleepycat.jdbc.DatabaseException" with whatever class you're looking for.
